

Methacton's Elementary School Students are 21st Century Learners!

Methacton's elementary students will now have greater access to technology with the installation of 30-station computer labs in each of the five schools.

The labs were populated with desktop computers from the fifth grade rooms in each building, as well as some desktops from other areas of the District. Students, as well as teachers, are excited to have a stationary lab where they can use technology as part of their lessons.

Methacton elementary school teachers have also been integrating the use of interactive whiteboards called "SMART Boards" into classroom lessons for years now. Additional opportunities for faculty to attend multiple in-service sessions on how to incorporate SMART Board lessons within their curriculum has increased the use of this exciting tool, and that training continues to be a popular in-service choice. Teachers enjoy using SMART Boards because they engage students, reach multiple learning styles, and allow students to interact with and manipulate the content. Students enjoy using SMART Boards because they make learning fun!
